Myoglobin FS*  

Diagnostic reagent for quantitative in vitro determination of myoglobin in serum or plasma on photometric systems

Order Information
Cat. No. Kit size
1 7098 99 10 935 R1 2 x 12 mL + R2 1 x 8 mL
1 7030 99 10 058 4 x 1 mL TruCal Myoglobin: Calibrator set with 4 different levels

Summary [1-6]
Myoglobin is an oxygen-binding heme protein present in cardiac and skeletal muscle. In case of a damage of these muscles, as in the case of an acute myocardial infarction (AMI) or muscle trauma, myoglobin is released in the blood circulation. After an AMI it can already be measured in the blood 2 - 3 hours from chest pain onset reaching pathological levels before other cardiac markers like creatin kinase (CK) or its MB isoenzyme (CK-MB). Myoglobin achieves peak levels after 7 - 10 hours returning to values within the reference range after approx. 24 hours. The determination of myoglobin represents a rapid and sensitive laboratory test which complements the ECG during the early phase of AMI. If myoglobin is still within the reference range 8 hours after onset of chest pain, an AMI can be excluded with great probability.

Under thrombolytic therapy a rapid and steep increase of myoglobin (≥ 150 µg/L/h or a relative increase >4-fold in 90 min after begin of treatment) is suggestive of a successful reperfusion. Increased concentrations of myoglobin in blood can also be measured in conditions not associated with AMI such as muscle trauma, myopathies, strong physical exercise, kidney insufficiency or rhabdomyolysis.

Method
Particle enhanced immunoturbidimetric test

Principle
Fixed time determination of the concentration of myoglobin through photometric measurement of antigen-antibody-reaction among antibodies to human myoglobin coated to latex particles and myoglobin present in the sample

Reagents

Components and Concentrations
R1: Buffer pH 8.3
Glycine < 1.5%
R2: Buffer pH 7.3
Latex particles coated with anti-myoglobin antibodies (rabbit)
Glycine < 1.5%

Storage Instructions and Reagent Stability
The reagents are stable up to the end of the indicated month of expiry, if stored at 2 – 8 °C and contamination is avoided. Do not freeze the reagents!

Warnings and Precautions
1. The reagents contain sodium azide (0.9 g/L) as preservative. Do not swallow! Avoid contact with skin and mucous membranes!
2. The reagents contain animal material. Handle the product as potentially infectious according to universal precautions and good clinical laboratory practices.
3. In very rare cases, samples of patients with gammopathy might give falsified results [10].
4. Please refer to the safety data sheets and take the necessary precautions for the use of laboratory reagents. For diagnostic purposes, the results should always be assessed with the patient’s medical history, clinical examinations and other findings.
5. For professional use only!

Waste Management
Please refer to local legal requirements.

Reagent Preparation
The reagents are ready to use. The latex reagent (R2) must be carefully mixed before use.

Materials required but not provided
NaCl solution 9 g/L
General laboratory equipment

Specimen
Serum or plasma (EDTA, heparin, citrate)

Stability [7]:
1 week at 2 – 8°C
3 months at -20°C

Discard contaminated specimens. Only freeze once!

Assay Procedure
Application sheets for automated systems are available on request.
Wavelength 580 nm
Optical path 1 cm
Temperature 37°C
Measurement Against reagent blank

ΔA= (A2 – A1) sample or calibrator

Calculation
The myoglobin concentration of unknown samples is derived from a calibration curve using an appropriate mathematical model such as spline. The calibration curve is obtained with four calibrators at different levels and NaCl solution (9 g/L) for determination of the zero value.
Stability of calibration: 4 weeks.

Conversion factor
Myoglobin [µg/L] x 0.059 = Myoglobin [nmol/L]

Calibrators and Controls
For the calibration of automated photometric systems, DiaSys TruCal Myoglobin calibrator set is recommended. The assigned values of the calibrators have been made traceable to a reference preparation based on pure antigen. For internal quality control, DiaSys TruLab Protein control should be assayed. Each laboratory should establish corrective action in case of deviations in control recovery.

Performance Characteristics

Measuring Range
The measuring range is from 5 – 600 µg/L, at least up to the concentration of the highest calibrator. When values exceed this range the samples should be diluted 1+2 with NaCl solution (9 g/L) and the result multiplied by 3.

Prozone Limit
No prozone effect was observed up to a myoglobin value of 15000 µg/L.

Specificity/Interferences
Due to its antibodies, DiaSys Myoglobin FS is a specific immunoassay for human myoglobin. No interference was observed by conjugated and unconjugated bilirubin up to 60 mg/dL, hemoglobin up to 1000 mg/dL, lipemia up to 1000 mg/dL triglycerides, and RF up to 500 IU/mL. For further information on interfering substances refer to Young DS [8].

Sensitivity/Limit of Detection
The lower limit of detection is 5 µg/L.

Precision (n = 20)

Method Comparison
A comparison of DiaSys Myoglobin FS (y) with a commercially available assay (x) using 95 samples gave the following results: $y = 1.071x + 3.095$ µg/L; $r = 0.996$

Reference Range [3]
Men and women < 70 µg/L (4.13 nmol/L)

Each laboratory should check if the reference ranges are transferable to its own patient population and determine own reference ranges if necessary
